The nursing profession: public image, self-concept and professional identity. A discussion paper

Yvonne ten Hoeve, Gerard Jansen & Petrie Roodbol

Abstract

Aim. To discuss the actual public image of nurses and other factors that influence the development of nurses' self-concept and professional identity.

Background. Nurses have become healthcare professionals in their own right who possess a great deal of knowledge. However, the public does not always value the skills and competences nurses have acquired through education and innovation.

Design. Discussion paper.

Data sources. We identified 1216 relevant studies by searching MEDLINE, CINAHL and PsycINFO databases in the period 1997–2010. Finally, 18 studies met our inclusion criteria.

Discussion. The included studies show that the actual public image of nursing is diverse and incongruous. This image is partly self-created by nurses due to their invisibility and their lack of public discourse. Nurses derive their self-concept and professional identity from their public image, work environment, work values, education and traditional social and cultural values.

Implications for nursing. Nurses should work harder to communicate their professionalism to the public. Social media like the Internet and YouTube can be used to show the public what they really do.

Conclusion. To improve their public image and to obtain a stronger position in healthcare organizations, nurses need to increase their visibility. This could be realized by ongoing education and a challenging work environment that encourages nurses to stand up for themselves. Furthermore, nurses should make better use of strategic positions, such as case manager, nurse educator or clinical nurse specialist and use their professionalism to show the public what their work really entails.

Keywords: job performance, literature review, nurses, perception, professional identity, public image, self-concept
Introduction

The professionalization of nurses through education and innovation has proven to be the focus of one of the most significant and ongoing discussions in the history of nursing. Worldwide, nurses have developed themselves into professionals with a great deal of knowledge, as witnessed by the development of nursing protocols and guidelines. Despite these developments towards professionalization, previous studies on this subject have shown that nurses are not given due recognition for the skills they have by the majority of the public. The essence of nursing is not always clear and nurses still suffer from (gender) stereotypes (Bridges 1990, Hallam 1998, Warner et al. 1998). A stereotype can be defined as 'a cognitive representation or impression of a social group that people form by associating particular characteristics and emotions with the group' (Smith & Mackie 2007). Bridges (1990) identified 34 different stereotypes of nurses, most of which have negative connotations. Bridges’ study also showed that the media often depict nurses working at the patient’s bedside and performing repetitive and routine tasks, mostly as the doctor’s handmaiden (Bridges 1990). Other studies indicate that the portrayal of nurses in the media might give a clue as to how their public image is perceived (Kalisch & Kalisch 1983, Warner et al. 1998, Gordon 2005). These studies show that the public image of nurses does not always match their professional image; nurses are not depicted as autonomous professionals and the public is not aware that nowadays nursing is to a great extent a theory-based and scholarly profession (Dominiak 2004). The nursing discipline has undergone tremendous developments over the last 30 years of the 20th century and in the first decade of the 21st century, in particular, with respect to professionalization. The professionalization of nursing is closely intertwined with a focus on the development of nursing theory (Meleis 1997), nursing research and nursing practice, which ideally are interrelated. Research can validate theory, which then may change nursing practice (Donahue 1998). Nightingale and Henderson have been visible forces for nursing across boundaries, in respectively the 19th and the 20th century. Moreover, the nursing profession has developed numerous types of education programmes in the last decades, which resulted in a variety of nursing levels, like bachelor, master and doctoral degrees. Even the most respected news media sources belittle nursing, so readers do not get a sense that nurses are educated life-saving professionals (Summers & Summers 2009).

Although the phenomenon of nursing and its characteristics are carefully considered, this has not yet resulted in a public image that recognizes the scientific and professional development of the nursing profession. The aim of this paper is to discuss the current state of affairs regarding the public image of nurses worldwide and to analyse the potential influence of this image on the development of nurses’ self-concept and professional identity. A search of the literature is performed and recent publications on these themes are brought together to broaden this discussion.

Background

Although Florence Nightingale saw nursing as an independent profession that was not subordinate but equal to the medical profession (Nightingale 1969), for a long time nursing was seen as inseparable from the medical profession. The medical (male) dominance strongly influenced the role development, the image and the position of nurses (Hallam 2000, Gordon 2005, Fletcher 2006). Previous studies on this subject show that nurses have always been strongly aware of their subordination to the medical profession and are still experiencing high levels of dissatisfaction with their professional status. Twaddle and Hessler (1987) investigated how the domination of nursing by others originated. They found that in the Western civilization, domination began in the early 1900s, when medicine became a dominant force and care of the sick became institutionalized. The study of Walby et al. (1994) shows that the nursing and medical professions in Western Europe have a complicated relationship, which amongst others is mediated by hierarchy and subordination. The workplace studies of Adamson et al. (1995) and Aiken and Sloane (1997) demonstrated how the impact of medical dominance on autonomy and job satisfaction of nurses led to decreased patient outcomes. Adamson et al. (1995) examined the influence of perceived medical dominance on the workplace satisfaction of Australian and British nurses. The results of their study show that medical dominance is an obstacle to the workplace satisfaction of both Australian and British nurses, who experienced a high degree of dissatisfaction with their professional status. Historically, nurses deferred to physicians, for reasons that include the disparity of power between the genders (Summers & Summers 2009). However, understanding nursing and the development of nursing and medicine cannot be separated from understanding the societal context, as Kalisch and Kalisch (1995) demonstrate in their study on American nursing.

The traditional role and image of nurses can be seen as the expressions of an oppressed group. The dominance of the oppressor, in this case the physician, marginalizes the oppressed group and may lead to the development of low self-concept, which can in turn lead to negative self-presentation (Fletcher 2006, 2007). Self-concept is closely related...
to professional self-concept, which is a prerequisite for the vocational and academic development of the identity of a profession (Arthur 1995, Arthur & Randle 2007).

The idea of being subordinated to the medical profession is not the only factor that influences the self-concept and professional identity of nurses. Other determinants include work environment, work values, education and culture. Professional identity and self-concept can undergo changes due to interactions with colleagues, other healthcare professionals and patients. Work environment and work values can also play a role in this respect (Mills & Blaesing 2000, Ewens 2003, Allen 2004). Education and the acquisition of knowledge are likely to have an impact on nurses’ job satisfaction and self-concept (Arthur 1992, Pask 2003). Furthermore, international differences in traditional cultural and social values need to be taken into account when measuring nurses’ professional identity and self-concept (Fealy 2004, Thupayagale-Tshweneagae & Dithole 2007).

There is a strong need for a discussion on the image, the self-concept and the professional identity of nurses in a global context. The outcomes of such a discussion can help nurses develop strategies to achieve a public image that reflects their scholarship and professionalism. This paper looks at the characteristics of the international development of these important issues.

Data sources

Search methods

A literature search was performed using the databases MEDLINE, CINAHL and PsycINFO. The search strategy aimed to retrieve suitable studies published between 1997 and 2010. The search terms used were nurses, nurse*, perception, public image, professional image, stereotyp*, self concept, power, public opinion and social identification. Original research was included if it was published in English and available as a full-text article. The research design of the studies had to be clear, with sample, instrument(s) and statistical method explicitly described.

Search outcome

The first search resulted in 1216 citations. After screening these on title, 287 abstracts were included for further assessment. The first author assessed the abstracts on their relevance for the purpose of the study, which resulted in 58 articles. These were reviewed by all authors and finally 18 articles were included in this discussion paper. Relevant studies included studies that examined the role of the public image of the nursing profession, studies that analysed the way nurses develop their self-concept and professional identity or studies that looked at the influence of the public image on nurses’ self-concept and professional identity. Figure 1 shows a flow chart of the selection process.

The included studies were heterogeneous with respect to design, sample and setting. The samples vary from 1957 RNs to five communication professionals. The settings were a university nursing school, the clinical setting of a hospital or a variety of settings. The included studies were conducted in Australia (3), Brazil (3), Sweden (3), USA (3), Taiwan (2), Hong Kong (1), Israel (1), Japan (1) and Norway (1).

Data abstraction and synthesis
A keyword analysis was performed based on the concepts of public image, professional identity and self-concept. Next, a content analysis of the included studies was conducted to systematically identify the main characteristics of the studies on the basis of the terms public image, self-concept and professional identity. Extracted data included author(s), year and country of publication, study design, quality of the study, sample, instrument(s), data analysis, aim of the study, outcomes on public image, outcomes on self-concept and professional identity and comments. The main characteristics of the 18 included studies are presented in Table 1.

Subsequently, the articles were judged on their substantive concepts to identify the main themes. Five main themes were identified: (1) work environment and work values; (2) education and career choice; (3) traditional values, culture and gender; (4) caring; and (5) identity and performance. The themes and related studies are presented in Table 2.

Discussion
Nurses’ depiction in the media
The image of nursing is determined by how nurses themselves and others (the public) perceive nursing. Earlier studies have indicated that the public image of nurses often differs from nurses’ own image of nursing. This public image is predominantly based on misconceptions and stereotypes, which find their origins in distorted images of nurses in the media. The media plays a part in perpetuating the stereotype of the nurse as angels of mercy, the doctor’s handmaiden, battleaxe and sexy nurse (Bridges 1990, Hallam 1998, Gordon & Nelson 2005). Due to such images, the public views nurses as feminine and caring, but not necessarily as autonomous healthcare providers (Takase et al. 2006, Kemmer & Silva 2007). Kalisch and Kalisch (1981, 1982a,b,c, 1983) have conducted extensive research on the image of nursing in the media (newspapers, TV, films, novels). They identified six images of nurses corresponding to six different periods: (1) Angel of Mercy (1854–1919); (2) Girl Friday (1920–1929); (3) Heroine (1930–1945); (4) Mother (1946–1965); (5) Sex Object (1960–1982); and (6) Careerist (1983–Present). The presence of these stereotypical images is confirmed by Gordon (2005), who analysed the image of nurses in advertising campaigns and found that even though much has changed for women in the 20th century, images of nurses still rely on images of angels. Nurses are generally prized for their virtues, not their knowledge. In contrast, the study of Stanley (2008), who analysed the image of nurses in feature films made in the Western world, shows a more nuanced picture. Stanley (2008) examined 36,000 feature film synopses and found that while early films portrayed nurses as self-sacrificial heroines, sex objects and romantics, more recent films portray nurses as strong and self-confident professionals. A recent study of Kelly et al. (2012) discussed how nurses and nursing identities are constructed in video clips on YouTube. Three nursing identity types could be found as follows: the nurse as ‘a skilled knower and doer’, the nurse as ‘a sexual plaything’ and the nurse as ‘a witless incompetent individual’. Although the results of these studies show a rather heterogeneous picture of the image of nursing, the stereotypical images of nurses nevertheless remain persistent.

We have identified several aspects of these stereotypical images in the studies discussed in this paper and, as can be expected from the outcomes of previous studies, the results show that the actual public image of nursing is diverse and incongruous and tends to be influenced by nursing stereotypes (Öhlén & Segesten 1998, Takase et al. 2002). With respect to male nurses, men were either portrayed as the second sex in nursing care (Dahlborg-Lyckhage & Pilhammar-Anderson 2009), or as nurses with different work patterns who are not influenced by marriage (Liu 2010). Öhlén and Segesten (1998) demonstrate that male nurses experience uncertainty from other people meeting a male nurse as a result of stereotyped images.

The media’s projection of images of nurses, in ways that neglect the official requirements of the profession, also has an impact on the view of the public on nursing (Takase et al. 2001, Dahlborg-Lyckhage & Pilhammar-Anderson 2009). Nurses seem to be viewed as feminine and caring, not as autonomous healthcare providers (Takase et al. 2006, Kemmer & Silva 2007). Moreover, nursing is seen as a profession with limited career opportunities (Huffstuter et al. 1998, Ben Natan & Becker 2010). Donelan et al. (2008) report more positive findings. They demonstrate that the nursing profession is highly respected by the American public, but nevertheless, the authors conclude that a nursing shortage persists in the USA. The study of Kalisch et al. (2007) also shows that nurses are seen as qualified, skilled and respectable professionals. The limitation is that, in their study, Professional Nursing Organizations and job sites are populating nursing on the internet. From the results of the studies, we may carefully conclude that the image of nurses in the media does not (yet) meet the professional image of nursing.

Defining image, self-image, self-concept and professional identity

In the included studies, the concepts image, self-image, self-concept and identity were used incongruously, even by the same author in the same study, thus making it difficult to come to a uniform definition. Self-image and self-concept, for instance, were used interchangeably, as were professional image and professional identity. For the sake of clarity, this paper restricts its focus to the terms self-concept and professional identity and uses the definition of Tajfel and Turner (1986) on self-concept, in general, which reads as follows: ‘the way we think about ourselves’. With respect to the self-concept of nurses, in specific, we rely on the definition of Takase et al.: ‘nurses’ self-concept can be defined as information and beliefs that nurses have about their roles, values and behaviours’ (Takase et al. 2002, p. 197).

The Social Identity Theory of Tajfel and Turner (1986) argues that the self-concept of an individual or a group (e.g. nurses) is derived from the perceived image of the group by society. When you assume that society thinks well of you, it will boost your self-concept and vice versa. Self-concept (the way we think about ourselves) can be used as an umbrella term, with self-image (the way we see ourselves), self-esteem (the way we feel about ourselves) and self-presentation (the way we present ourselves to others) as underlying concepts (Tajfel & Turner 1986). We chose to use the concept of self-concept throughout this paper because it applies mostly to the professional self (the profession), rather than to the psychological self (the person). Therefore, it can be linked to professional identity. Nurses’ professional identity is defined as ‘the values and beliefs held by nurses that guide her/his thinking, actions and interactions with the patient’ (Fagermoen 1997). The included studies show that professional identity can be reflected in the nurse’s professional self-concept, which is also based on the general public opinion on nurses (Öhlén & Segesten 1998, DeMeis et al. 2007). Congruence exists between the public image and nurses’ self-concept: nurses who perceive their public image to be negative are likely to develop low self-concept (Öhlén & Segesten 1998, Gregg & Magilvy 2001, Takase et al. 2002). In turn, nurses’ negative self-concept and presentation influence the public’s opinion (Tzeng 2006).

Work environment and work values

In 7 studies, work environment and work values were mentioned as factors of influence on nurses’ professional identity. Nurses learn from their work experiences and professional interaction with colleagues, in particular, is highly valued. In the study of Arthur et al. (1999), the professional self-concept, technological influences and caring attributes of 1957 Registered Nurses in 11 countries were examined. They found that the sample as a whole valued professional interaction with colleagues and believed in the skills of nurses. This view is shared by Gregg and Magilvy (2001), who also found that nurses learn from their work experiences. Through interaction with other nurses, they learn things about nursing and about themselves and working as a nurse may also contribute to their personal growth and self-concept (Gregg & Magilvy 2001). The Swedish nurses in the study of Öhlén and Segesten (1998) mentioned that they develop their professional identity through interaction with other nurses and by sharing their experiences in a narrative and reflective way. Takase et al. (2001) found...
that the participants in their study evaluated their performance as nurses positively and that this positive self-concept is related to the professional socialization process. Nurses develop a professional identity through the skills, knowledge and values inherent in their profession. The study of Fagermoen (1997) showed that working as nurses maintains and enhances their self-concept, both as nurses and as persons.

Education and career choice

Next to work environment, education and the presence of preceptors also contribute to nurses’ job satisfaction and self-concept. The nurses in the study of Fagerberg and Kihlgren (2001) mention that the influence of preceptors during education and in the work was very important. This view was shared by the participants in Gregg and Magilvy (2001) study on nurses in Japan. Some participants considered their (basic) nursing training to be low-level education, but most participants felt they had gained positive influences from their education, including continuing education after becoming a nurse. In contrast, De Araujo Sartorio and Pavone Zoboli (2010) found that the nurse teachers in their study seemed to be driven by historical scars that still influence their focus on the actual role of nurses and which in turn might have detrimental effects on the teaching and work of nurses.

Although nurses see themselves as well-trained professionals, the public still sees nursing as a low-status profession that is subordinate to the work of physicians, does not require any academic qualifications and lacks professional autonomy. The public is oblivious to the different levels of education and professionalism involved in nursing (DeMeis et al. 2007, Dahlborg-Lyckhage & Pilhammar-Anderson 2009, Liu 2010). The study of Huffstutler et al. (1998) shows that even though many of the respondents believe that education is important for becoming a nurse, the majority does not have a clear conception of the meaning and practice of the nursing profession. In a study on Israeli nurses, Ben Natan and Becker (2010) found a positive correlation between the image of nursing and the decision of students to choose a nursing career. They discovered that the more positive the image of nursing, the higher the chance that students would opt for a nursing career. Their findings also revealed that nursing is seen as a profession that has limited career opportunities and that the characteristics of nursing are incompatible with the characteristics of an ideal career.

However, these results contrast with the findings of Donelan et al. (2008), who performed a national survey of the public’s opinion of nursing and a national survey of Registered Nurses in the USA on their own opinion of nursing. Donelan et al. (2008) found that the public was more positive about a career in nursing than the nurses themselves. The qualifications the public named most frequently with respect to nursing included ‘highly knowledgeable, qualified, skilled’. Kalisch et al. (2007) share this view as a result of their study on the image of nurses on the Internet. With respect to education, nurses are described as being knowledgeable and skilled and more nurses who hold a doctoral degree are mentioned than in the past. However, we must keep in mind that these results are biased by the fact that the subjects were Professional Nursing Organizations, job sites and resource/Website directories.

Traditional values, culture and gender

The nursing profession continues to suffer from the influence of traditional values and cultural and social norms with respect to gender and professional status. Öhén and Segesten (1998) found that a stereotypical image of nurses is an expression of the tradition of viewing nursing as a part of the female sphere of the family. As a result, nurses are struggling for power in a gender-segregated society. In Brazil, for instance, nursing is still seen as a female and domestic vocation related to the social universe of the ‘house’. Nursing remains a predominantly feminine and domestic activity that has a low social status and is discredited by society. People look at the doctor who gets all the credits (DeMeis et al. 2007, Kemmer & Silva 2007). The online forum used by Liu (2010) to explore nurses’ perceptions of their work role on the basis of Chinese cultural and gender roles shows similar results. Participants mentioned that they would not encourage their children, especially their sons, to become nurses. The author argues that one of the main underlying reasons for this negative view of nursing is to be found in the traditional norms and values in Chinese culture. The Chinese caring system, where persons with lower status should care for those with higher status, qualifies nurses as caregivers with low professional status and as subordinates to physicians. Nursing is still seen as a feminine, caring sub-professional occupation rather than a profession (Liu 2010). The study of Dahlborg-Lyckhage and Pilhammar-Anderson (2009) on predominant discourses in Swedish nursing shows that the image of nurses in gendered discourse has been mainly negative. Nursing was, and sometimes still is, portrayed as a female profession, with nurses playing supporting roles to physicians and occupying a subordinate position with regard to decision-making and delegating tasks. These
Caring

Caring was the most commonly identified factor of influence on the development of nurses’ self-concept and professional identity (mentioned in 11 studies). The nursing profession is strongly associated with caring, both by the public and by nurses themselves. However, a discrepancy exists in the interpretation of the concept of caring. The studies show that nurses consider caring to be part of their professional identity, whereas the public associates caring with feminine qualities and unprofessionalism. Today’s nurses try to gain recognition for the importance of caring in a society where caring is undervalued (Öhlén & Segesten 1998). Nurses are viewed by the public as feminine and caring professionals, but they are not recognized as leaders or independent healthcare professionals (Takase et al. 1998). The results of the study of Huffstutler et al. (1998) indicate that nursing is seen as the profession most closely associated with caring. Despite the technological developments in health care, nurses are considered to be caring persons and thus the most important requirement for becoming a nurse is to be able to care for others.

With regard to nurses themselves, the extensive study of Arthur et al. (1999) showed that nurses in all 11 countries believe in a confidential relationship between nurses and their patients based on truthfulness and respect. Despite their individual cultural features, nurses across the world do have much in common when it comes to caring and their practice. Nurses believe that the primary responsibility of nurses is to perform nursing care for patients and to ensure their patients’ well-being (Fagerberg & Kihlgren 2001, Dahlborg-Lyckhage & Pilhammar-Anderson 2009). Fagermoen (1997) shows that for most of the nurses in her study, the value of care for the patients’ health and well-being appears to be an overriding value, on which they base their practice. Positive correlations have also been found between choosing nursing as a career and intrinsic factors, such as caring for others, helping others and feeling responsible for others (Ben Natan & Becker 2010). In contrast, the study of DeMeis et al. (2007) showed that nurses themselves may also consider caring to be an unprofessional activity. The respondents state that when nurses reach higher professional standards, patient care is delegated to a socially less-valued professional category that requires lower academic qualifications.

Identity and performance

Nine studies mentioned the poor communication of nurses with the public and the invisibility of nurses in the media. A common theme in these studies is that nurses should do their best to improve the negative image of their profession, whereby keeping the goal to recruit new students in mind. The studies emphasize the shortage of nurses, which is partly caused by nurses themselves, who do too little to recommend their careers to others (Takase et al. 2006, Donelan et al. 2008). Nurses need to counteract the effects of nurse stereotyping and improve the public image of their profession. A stereotypical public image is also partially responsible for the way nurses perceive and use power. Nurses need power to improve their visibility (Takase et al. 2002, Tzeng 2006). According to Kemmer and Silva (2007), nursing professionals have partly inflicted their invisibility in the media on themselves. As long as nurses do not feel responsible for the distorted images of the roles they have performed and are still performing in health care and as long as they do not take a stand to correct these images, their invisibility will continue. Nurses need to raise public awareness about the various roles and opportunities both basic and advanced nursing practice have to offer. To give more visibility to the nursing role, a strategy needs to be developed, which will use the (social) media (Internet, TV, internal news, press) to inform the public (Kalisch et al. 2007, Kemmer & Silva 2007).

Implications for nurses

Around the world, nursing baccalaureate, master and doctoral degree programmes prepare nurses for a variety of nursing roles. Nurses are educated to develop nursing theories and conceptual models, conduct nursing research and test nursing theories (Meleis 1997). As a result, nursing is becoming more scholarly. The public needs to become aware that nursing research exists and that it is important to patient health. This awareness, in turn, will have a positive effect on the public image of nursing and will empower nurses.

This paper, however, shows that the public is not always aware of the qualifications nurses need for their profession. The public image of nursing is, to a large extent, affected by the invisibility of nurses and the way they present themselves. Ineffective communication skills influence the public perception of nurses. Nurses should work harder to
What is already known about the topic

- The professionalization of nurses and the public image of the nursing profession is the subject of ongoing international debates.
- A negative public image has a negative impact on nurses’ self-concept and the development of their professional identity.
- The professional aspects of the work nurses perform remain invisible in the media, partly as a result of the dominant position of the medical profession.

What this paper adds

- A discussion of the influence of the public image on the self-concept and the professional identity of nurses in an era of nurse professionalization.
- An analysis of other factors that influence the self-concept of nurses, such as work environment, work values, education and traditional social and cultural values.

Implications for practice and/or policy

- Nurses should work harder to communicate both their professionalism and their contribution to the healthcare system to the public.
- To be given due recognition, nurses could profit from using social media, such as the Internet and YouTube.
- In the curriculum of nursing schools, more attention should be given to performance and empowerment of nurses.

Recommendations

We argued in this paper that, to become more visible inside and outside healthcare organizations, nurses should present themselves more clearly to the public. This could be achieved by pursuing higher education and by working in a challenging work environment that offers nurses the opportunity to break away from the daily routine and that challenges them to deepen and broaden their knowledge and skills. Job rotation, gaining professional autonomy, opportunities for interprofessional learning and peer consultation could help nurses to become more visible within their organization and on a macro level, within society. Nurses could, for example, create a more challenging work environment by embracing a more active attitude that includes participation in representative bodies and unions. Interaction with other nurses and working as a nurse may contribute to the development of their self-concept and identity as a nurse. Out of their professional identity, nurses can also adopt and develop new leadership roles. Nursing research can be helpful to further the profession and research outcomes could be used to improve the development of professional identity. Another strategy that could help nurses is to participate in the development of cross-national knowledge about nursing practice. It would be very interesting to examine in which countries nurses are ‘doing well’ in respect to public image and consequently represent their professionalism in the eyes of society.

Conclusion

This discussion paper gives an overview of the current state of affairs with regard to public image, self-concept and professional identity of nurses. The findings show a rather diverse picture of the actual view of the public on the nursing profession. The heterogeneity of setting, sample and population of the studies makes it quite difficult to explain these differences. Furthermore, traditional cultural and social values determine the way the public perceives the nursing profession. The self-concept of nurses and their professional identity are determined by many factors, including public image, work environment, work values, education and culture. Virginia Henderson (1978) already stated that ‘nurses self-image is often at odds with the public’s image and what nurses do is at odds with what nurses and the public think they should do’. A negative public image may challenge nurses to look for successful strategies to improve their self-concept and to show their invaluable contribution to the healthcare system. One of the strategies is to promote nursing by giving lectures to spread information on the profession. As educators and role models, they can establish a professional nurse identity. Professional development of nurses could also be realized by sharing their work experiences with other...
nurses. In addition, nurses should make better use of strategic positions, such as case manager, nurse educator or clinical nurse specialist to show what their work as healthcare professionals entails. The public should be able to identify with nurses and the work they do. In the media, nurses are hardly seen as professional advisors or experts. A convincing number of nurses is needed to change the public opinion. Kalisch and Kalisch (1983) state that nurses can intervene in four steps: (1) getting organized; (2) monitoring the media; (3) reacting to the media; and (4) fostering an improved image. Unless nurses themselves establish a public image and professional identity that recognizes the value of their professional and educational development, the problem of a ‘fuzzy’ and inaccurate image will continue to exist.

We would like to thank Sonja Hintzen of the University Medical Center Groningen for her constructive advice and editing services.

Funding

The authors received no external funding or grant to undertake this research.

Conflict of interest

The authors declare that there is no conflict of interest.

Author contributions

YH and PR were responsible for the study conception and design; YH performed the data collection; YH and PR performed the data analysis; YH, PR and GJ were responsible for the drafting of the manuscript.

All authors have agreed on the final version and meet at least one of the following criteria (recommended by the ICMJE: http://www.icmje.org/ethical_1author.html):

- substantial contributions to conception and design, acquisition of data, or analysis and interpretation of data;
- drafting the article or revising it critically for important intellectual content.

References

The *Journal of Advanced Nursing (JAN)* is an international, peer-reviewed, scientific journal. JAN contributes to the advancement of evidence-based nursing, midwifery and health care by disseminating high quality research and scholarship of contemporary relevance and with potential to advance knowledge for practice, education, management or policy. JAN publishes research reviews, original research reports and methodological and theoretical papers.

For further information, please visit JAN on the Wiley Online Library website: www.wileyonlinelibrary.com/journal/jan

**Reasons to publish your work in JAN:**

- **High-impact forum:** the world’s most cited nursing journal, with an Impact Factor of 1·527 – ranked 14/101 in the 2012 ISI Journal Citation Reports © (Nursing (Social Science)).
- **Most read nursing journal in the world:** over 3 million articles downloaded online per year and accessible in over 10,000 libraries worldwide (including over 3,500 in developing countries with free or low cost access).
- **Fast and easy online submission:** online submission at http://mc.manuscriptcentral.com/jan.
- **Positive publishing experience:** rapid double-blind peer review with constructive feedback.
- **Rapid online publication in five weeks:** average time from final manuscript arriving in production to online publication.
- **Online Open:** the option to pay to make your article freely and openly accessible to non-subscribers upon publication on Wiley Online Library, as well as the option to deposit the article in your own or your funding agency’s preferred archive (e.g. PubMed).
